

NetLegal Server Installation Guide

Before installing the NetLegalIndex Client and/or Manager on any computers, the NetLegal Server must be installed on one computer located within the network meeting the following system requirements:

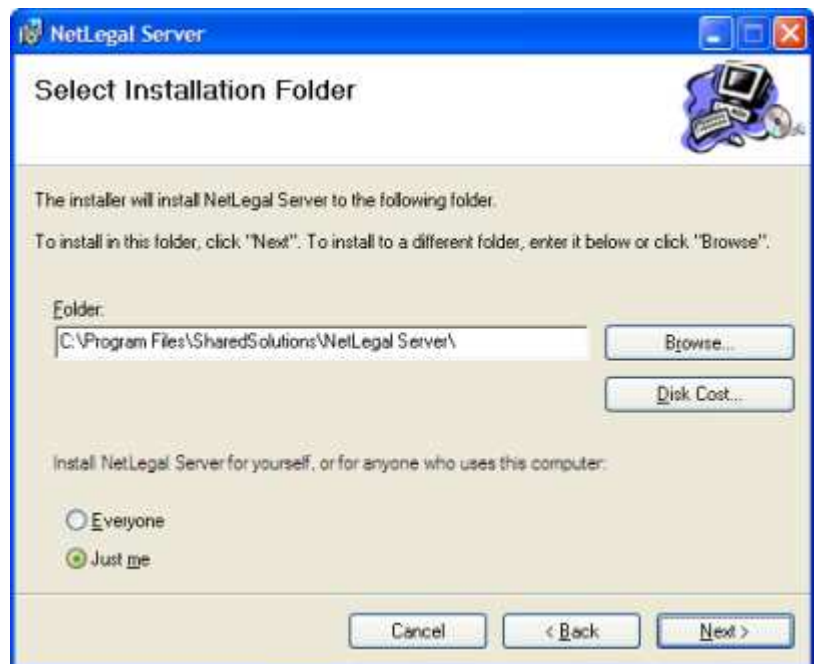

- .Net Framework version 3.5 or greater installed (This can be found on <http://www.netlegal.ca/downloads/downloads.html>)
- 2005 or 2008 C++ runtime package installed (This can be found on <http://www.netlegal.ca/downloads/downloads.html>)
- Windows XP SP3 or greater

If they do not exist on your computer, you will be prompted during the installation to install any missing components.

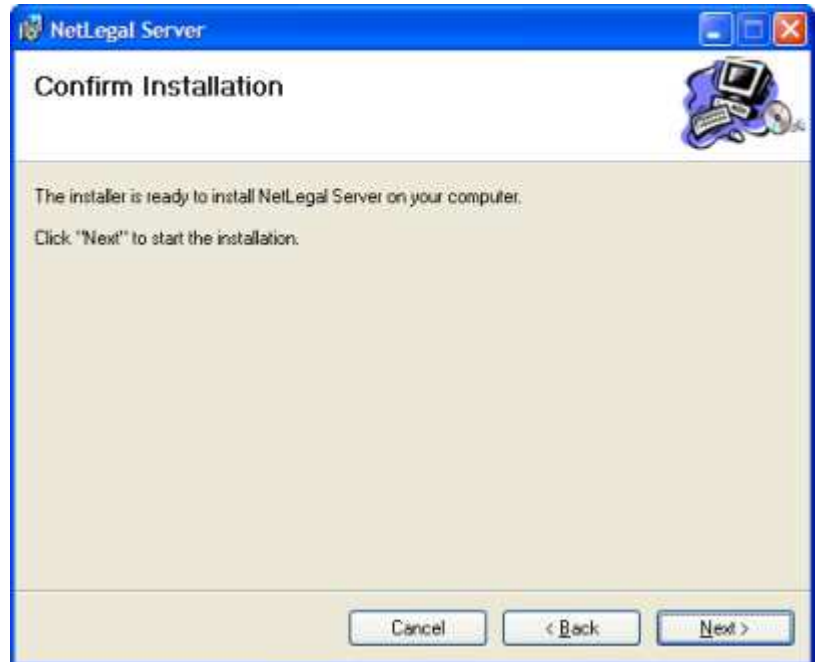

Installation

When the NetLegal Server Setup Wizard is up on your computer screen:

1. Click **Next** on the Select Installation Folder screen once you have selected a folder and whether you want to install the server for everyone who uses your computer or just for yourself.

2. Click **Next** on the Confirm Installation screen to continue the installation process.

3. Installation is complete. Users can now install the NetLegalIndex Client and/or Manager on their computers.

After the server installation completes, the server will automatically start and the initial database will be created (no reboot required).

The server runs as a windows service under the name 'NetLegal Server' and the database resides in the **c:\dbe directory**. The Network Service account is required to have full access to all folders and files under the initial c:\dbe directory. Each night at 3am (server time), the server will automatically create backups of the databases and place them in the c:\dbe\backups directory. These backups automatically rotate out every 7 days so you may wish to backup these files in a separate process if you wish to keep them longer.

Communications - Firewall Settings

The server uses the following TCP ports to communicate with each client:

40010	-	SQL Communications
40011	-	Incoming file transfer
40012	-	Outgoing file transfer

Please make sure that the client machines have full access to these ports or they will not be able to connect to the server or have reduced functionality. It is advised to add the server and client applications to the list of exceptions to the firewall.
